

ABSTRACT

A tie-out that is attachable to a door and allows a user to secure an object or a pet to the door is disclosed. When used with pets, the tie-out allows the user to connect a pet's leash to either side of a door without having to remove and reconfigure the tie-out, and is also configured to hold a pet's leash securely to a door without coming loose or damaging the door. Typically the tie-out is mounted to the bottom edge of the door, but may be mounted on a side edge of the door depending upon the design. In addition, the tie-out is not confined to use with doors located on the inside of a building and can be connected to doors that lead to the outside of a building.
